Assignment #7

Due on Monday, October 12, 2009

Read Section 7.1 on *Limits,* pp. 171–178, in Bressoud.

Background and Definitions

- *(Open Set)* A subset, U, of $\mathbb{R}^n$ is said to be **open** if for any $x \in U$ there exists a positive number r such that $B_r(x) = \{y \in \mathbb{R}^n \mid \|y - x\| < r\}$ is entirely contained in U. (The empty set, $\emptyset$, is considered to be an open set.)

- *(Continuous Functions 1)* Let U denote an open subset of $\mathbb{R}^n$. A function $F \colon U \to \mathbb{R}^m$ is said to be continuous at $x \in U$ if and only if

$$\lim_{\|y-x\|\to 0} \|F(y) - F(x)\| = 0.$$

  If F is continuous at every point in U, then F is said to be continuous **on** U.

- *(Pre–image)* If $B \subseteq \mathbb{R}^m$, the *pre–image of* B under the map $F \colon U \to \mathbb{R}^m$, denoted by $F^{-1}(B)$, is defined as the set $F^{-1}(B) = \{x \in U \mid F(x) \in B\}$.

  Note that $F^{-1}(B)$ is always defined even if F does not have an inverse map.

- *(Continuous Functions 2)* Let U denote an open subset of $\mathbb{R}^n$. A function $F \colon U \to \mathbb{R}^m$ is continuous on U if and only if, for every open subset V of $\mathbb{R}^m$, the pre–image of V under F, $F^{-1}(V)$ is open in $\mathbb{R}^n$.

- *(Composition of Continuous Functions)* Let U denote an open subset of $\mathbb{R}^n$ and Q an open subset of $\mathbb{R}^m$. Suppose that the maps $F \colon U \to \mathbb{R}^m$ and $G \colon Q \to \mathbb{R}^k$ are continuous on their respective domains and that $F(U) \subseteq Q$. Then, the composition $G \circ F \colon U \to \mathbb{R}^k$ is continuous on U.

Do the following problems

1. Let U denote an open subset of $\mathbb{R}^n$. Suppose that $f \colon U \to \mathbb{R}$ is a scalar field and $G \colon U \to \mathbb{R}^m$ is vector valued function.

   (a) Explain how the product fG is defined.

   (b) Prove that if both f and G are continuous on U, then the vector valued function fG is also continuous on U.

2. Let U be an open subset of $\mathbb{R}^2$. Let $f\colon U \to \mathbb{R}$ and $g\colon U \to \mathbb{R}$ be two scalar fields on U, and define $h\colon U \to \mathbb{R}$ by
$$h(x,y) = f(x,y)g(x,y) \quad \text{for all} \quad (x,y) \in U.$$
Prove that if both f and g are continuous on U, then so is h.

   Suggestion: First prove that the function $G\colon \mathbb{R}^2 \to \mathbb{R}$, defined by $G(x,y) = xy$ for all $(x,y) \in \mathbb{R}^2$, is continuous. Then, let $F\colon U \to \mathbb{R}^2$ denote the map given by
$$F(x,y) = (f(x,y), g(x,y)) \quad \text{for all} \quad (x,y) \in U,$$
and observe that
$$h = G \circ F.$$

3. Let $U = \mathbb{R}^n \backslash \{\mathbf{0}\} = \{v \in \mathbb{R}^n \mid v \neq \mathbf{0}\}$.

   (a) Prove that U is an open subset of $\mathbb{R}^n$.

   (b) Define $f\colon \mathbb{R}^n \to \mathbb{R}$ by
$$f(v) = \frac{1}{\|v\|} \quad \text{for all} \quad v \in U.$$
Prove that f is continuous on U.
Suggestion: Note that the function, g, defined by
$$g(t) = \frac{1}{t} \quad \text{for all } t \neq 0,$$
is continuous for $t \neq 0$.

4. Let $I \subseteq \mathbb{R}$ be an open interval and $\sigma\colon I \to \mathbb{R}^n$ be continuous path in $\mathbb{R}^n$ satisfying $\sigma(t) \neq \mathbf{0}$ for all $t \in I$. Define the function $f\colon I \to \mathbb{R}$ by
$$f(t) = \frac{1}{\|\sigma(t)\|} \quad \text{for all} \quad t \in I.$$
Prove that f is continuous on I.

5. Exercise 12 on page 180 in the text.
