## Review Problems for Exam 2

1. Define the scalar field $f: \mathbb{R}^{n} \rightarrow \mathbb{R}$ by $f(v)=\frac{1}{2}\|v\|^{2}$ for all $v \in \mathbb{R}^{n}$. Show that $f$ is differentiable on $\mathbb{R}^{n}$ and compute the linear map $D f(u): \mathbb{R}^{n} \rightarrow \mathbb{R}$ for all $u \in \mathbb{R}^{n}$. What is the gradient of $f$ at $u$ for all $x \in \mathbb{R}^{n}$ ?
2. Let $g:[0, \infty) \rightarrow \mathbb{R}$ be a differentiable, real-valued function of a single variable, and let $f(x, y)=g(r)$ where $r=\sqrt{x^{2}+y^{2}}$.
(a) Compute $\frac{\partial r}{\partial x}$ in terms of $x$ and $r$, and $\frac{\partial r}{\partial y}$ in terms of $y$ and $r$.
(b) Compute $\nabla f$ in terms of $g^{\prime}(r), r$ and the vector $\mathbf{r}=x \widehat{i}+y \widehat{j}$.
3. Let $f: U \rightarrow \mathbb{R}$ denote a scalar field defined on an open subset $U$ of $\mathbb{R}^{n}$, and let $\widehat{u}$ be a unit vector in $\mathbb{R}^{n}$. If the limit

$$
\lim _{t \rightarrow 0} \frac{f(v+t \widehat{u})-f(v)}{t}
$$

exists, we call it the directional derivative of $f$ at $v$ in the direction of the unit vector $\widehat{u}$. We denote it by $D_{\widehat{u}} f(v)$.
(a) Show that if $f$ is differentiable at $v \in U$, then, for any unit vector $\widehat{u}$ in $\mathbb{R}^{n}$, the directional derivative of $f$ in the direction of $\widehat{u}$ at $v$ exists, and

$$
D_{\widehat{u}} f(v)=\nabla f(v) \cdot \widehat{u},
$$

where $\nabla f(v)$ is the gradient of $f$ at $v$.
(b) Suppose that $f: U \rightarrow \mathbb{R}$ is differentiable at $v \in U$. Prove that if $D_{\widehat{u}} f(v)=$ 0 for every unit vector $\widehat{u}$ in $\mathbb{R}^{n}$, then $\nabla f(v)$ must be the zero vector.
(c) Suppose that $f: U \rightarrow \mathbb{R}$ is differentiable at $v \in U$. Use the CauchySchwarz inequality to show that the largest value of $D_{\widehat{u}} f(v)$ is $\|\nabla f(v)\|$ and it occurs when $\widehat{u}$ is in the direction of $\nabla f(v)$.
4. The scalar field $f: U \rightarrow \mathbb{R}$ is said to have a local minimum at $x \in U$ if there exists $r>0$ such that $B_{r}(x) \subseteq U$ and

$$
f(x) \leqslant f(y) \text { for every } y \in B_{r}(x)
$$

Prove that if $f$ is differentiable at $x \in U$ and $f$ has a local minimum at $x$, then $\nabla f(x)=\mathbf{0}$, the zero vector in $\mathbb{R}^{n}$.
5. Let $I$ denote an open interval in $\mathbb{R}$. Suppose that $\sigma: I \rightarrow \mathbb{R}^{n}$ and $\gamma: I \rightarrow \mathbb{R}^{n}$ are paths in $\mathbb{R}^{n}$. Define a real valued function $f: I \rightarrow \mathbb{R}$ of a single variable by

$$
f(t)=\sigma(t) \cdot \gamma(t) \quad \text { for all } t \in I
$$

that is, $f(t)$ is the dot product of the two paths at $t$.
Show that if $\sigma$ and $\gamma$ are both differentiable on $I$, then so is $f$, and

$$
f^{\prime}(t)=\sigma^{\prime}(t) \cdot \gamma(t)+\sigma(t) \cdot \gamma^{\prime}(t) \quad \text { for all } t \in I
$$

6. Let $\sigma: I \rightarrow \mathbb{R}^{n}$ denote a differentiable path in $\mathbb{R}^{n}$. Show that if $\|\sigma(t)\|$ is constant for all $t \in I$, then $\sigma^{\prime}(t)$ is orthogonal to $\sigma(t)$ for all $t \in I$.
7. A particle is following a path in three-dimensional space given by

$$
\sigma(t)=\left(e^{t}, e^{-t}, 1-t\right) \quad \text { for } \quad t \in \mathbb{R} .
$$

At time $t_{o}=1$, the particle flies off on a tangent.
(a) Where will the particle be at time $t_{1}=2$ ?
(b) Will the particle ever hit the $x y$-plane? Is so, find the location on the $x y$ plane where the particle hits.
8. Let $U$ denote an open and convex subset of $\mathbb{R}^{n}$. Suppose that $f: U \rightarrow \mathbb{R}$ is differentiable at every $x \in U$. Fix $x$ and $y$ in $U$, and define $g:[0,1] \rightarrow \mathbb{R}$ by

$$
g(t)=f(x+t(y-x)) \text { for } 0 \leqslant t \leqslant 1
$$

(a) Explain why the function $g$ is well defined.
(b) Show that $g$ is differentiable on $(0,1)$ and that

$$
g^{\prime}(t)=\nabla f(x+t(y-x)) \cdot(y-x) \quad \text { for } 0<t<1
$$

(Suggestion: Consider

$$
\frac{g(t+h)-g(t)}{h}=\frac{f(x+t(y-x)+h(y-x))-f(x+t(y-x))}{h}
$$

and apply the definition of differentiability of $f$ at the point $x+t(y-x)$.)
(c) Use the Mean Value Theorem for derivatives to show that there exists a point $z$ is the line segment connecting $x$ to $y$ such that

$$
f(y)-f(x)=D_{\widehat{u}} f(z)\|y-x\|,
$$

where $\widehat{u}$ is the unit vector in the direction of the vector $y-x$; that is, $\widehat{u}=\frac{1}{\|y-x\|}(y-x)$.
(Hint: Observe that $g(1)-g(0)=f(y)-f(x)$.)
9. Prove that if $U$ is an open and convex subset of $\mathbb{R}^{n}$, and $f: U \rightarrow \mathbb{R}$ is differentiable on $U$ with $\nabla f(v)=\mathbf{0}$ for all $v \in U$, then $f$ must be a constant function.
10. Let $f$ be a scalar field defined on $(x, y)$ where $x=r \cos \theta, y=r \sin \theta$. Show that

$$
\nabla f=\frac{\partial f}{\partial r} \overrightarrow{\mathbf{u}}_{r}+\frac{1}{r} \frac{\partial f}{\partial \theta} \overrightarrow{\mathbf{u}_{\theta}},
$$

where $\overrightarrow{\mathbf{u}_{r}}=(\cos \theta, \sin \theta)$ and $\overrightarrow{\mathbf{u}_{\theta}}=(-\sin \theta, \cos \theta)$.
Hint: First find $\partial f / \partial r$ and $\partial f / \partial \theta$ in terms of $\partial f / \partial x$ and $\partial f / \partial y$ and then solve for $\partial f / \partial x$ and $\partial f / \partial y$ int terms of $\partial f / \partial r$ and $\partial f / \partial \theta$.
11. Let $U$ be an open subset of $\mathbb{R}^{n}$ and $I$ be an open interval. Suppose that $f: U \rightarrow$ $\mathbb{R}$ is a differentiable scalar field and $\sigma: I \rightarrow \mathbb{R}^{n}$ be a differentiable path whose image lies in $U$. Suppose also that $\sigma^{\prime}(t)$ is never the zero vector. Show that if $f$ has a local maximum or a local minimum at some point on the path, then $\nabla f$ is perpendicular to the path at that point.

Suggestion: Consider the real valued function of a single variable $g(t)=f(\sigma(t))$ for all $t \in I$.
12. Let $\sigma:[a, b] \rightarrow \mathbb{R}^{n}$ be a differentiable, one-to-one path. Suppose also that $\sigma^{\prime}(t)$, is never the zero vector. Let $h:[c, d] \rightarrow[a, b]$ be a one-to-one and onto map such that $h^{\prime}(t) \neq 0$ for all $t \in[c, d]$. Define

$$
\gamma(t)=\sigma(h(t)) \quad \text { for all } t \in[c, d] .
$$

$\gamma:[c, d] \rightarrow \mathbb{R}^{n}$ is a called a reparametrization of $\sigma$
(a) Show that $\gamma$ is a differentiable, one-to-one path.
(b) Compute $\gamma^{\prime}(t)$ and show that it is never the zero vector.
(c) Show that $\sigma$ and $\gamma$ have the same image in $\mathbb{R}^{n}$.
