Assignment #10

Due on Wednesday, October 16, 2013

Read Section 4.1 on *Expected Value of a Random Variable* in the class lecture notes at http://pages.pomona.edu/~ajr04747/

Read Section 4.1 on The Expectation of a Random Variable in DeGroot and Schervish.

Do the following problems

- 1. An experiment consists of tossing a balanced die until a 6 comes up. On average, how many tosses are required to get a 6? In other words, if X denotes the number of tosses it takes to get a 6, what is E(X)? Show your calculations and justify your reasoning.
- 2. Two discrete random variable, X and Y, are said to be **independent** if

$$Pr(X = x, Y = y) = Pr(X = x) \cdot Pr(Y = y)$$

for all possible values of x and y or X and Y, respectively.

Prove that if X and Y are discrete and independent, then

$$E(X + Y) = E(X) + E(Y).$$

- 3. Let X be a discrete random variable with pmf $p_X(x)$, and assume that $p_X(x)$ is positive at x = -1, 0, 1 and zero elsewhere.
 - (a) If $p_X(0) = \frac{1}{4}$, find $E(X^2)$.
 - (b) If $p_X(0) = \frac{1}{4}$ and if $E(X) = \frac{1}{4}$, determine $p_X(-1)$ and $p_X(1)$.
- 4. A bowl contains 10 chips, of which eight are marked \$2 and two are marked \$5 each. Let a person choose, at random and without replacement, three chips from the bowl. If the person is to receive the sum of the resulting amounts, find this expectation.
- 5. Let $p_X(k) = \left(\frac{1}{2}\right)^k$, for $k = 1, 2, 3, \ldots$, zero elsewhere, be the pmf of a discrete random variable X. Find the mean value of X.

Hint: For |t| < 1, define the function $f(t) = \sum_{k=0}^{\infty} t^k$. This is a geometric series which adds up to $\frac{1}{1-t}$. Compute f'(t).
