## Assignment \#16

Due on Monday, November 19, 2018
Read Section 5.4 on The Fundamental Theorem of Calculus, pp. 292-295, in Baxandall and Liebek's text.

Read Section 5.5 on Potential Functions and Conservative Fields, pp. 296-308, in Baxandall and Liebek's text.
Read Section 5.2 on Line Integrals in the class Lecture Notes at http://pages.pomona.edu/~ajr04747/.
Read Section 5.3 on Gradient Fields in the class Lecture Notes at http://pages.pomona.edu/~ajr04747/.
Read Section 5.4 on Flux Across Plane Curves in the class Lecture Notes at http://pages.pomona.edu/~ajr04747/.

## Background and Definitions

- (Path Connected Sets) A set $U \subseteq \mathbb{R}^{n}$ is said to be path connected if and only if for any vectors $p$ and $q$ in $U$, there exists a $C^{1}$ path $\sigma:[0,1] \rightarrow \mathbb{R}^{n}$ such that $\sigma(0)=p, \sigma(1)=q$ and $\sigma(t) \in U$ for all $t \in[0,1]$; i.e., any two elements in $U$ can be connected by a $C^{1}$ path whose image is entirely contained in $U$.
- (Flux Across a Simple, Closed Curve in $\left.\mathbb{R}^{2}\right)$ Let $U$ denote an open subset of $\mathbb{R}^{2}$ and $F: U \rightarrow \mathbb{R}^{2}$ be a two-dimensional vector field given by

$$
F(x, y)=P(x, y) \widehat{i}+Q(x, y) \widehat{j}, \quad \text { for all }(x, y) \in U
$$

where $P$ and $Q$ are scalar fields defined in $U$. Let $C$ denote a simple, piece-wise $C^{1}$, closed curve contained in $U$, which is oriented in the counterclockwise sense.
The flux of $F$ across $C$, denoted by $\oint_{C} F \cdot \widehat{n} d s$, is defined by

$$
\oint_{C} F \cdot \widehat{n} d s=\int_{C} P(x, y) d y-Q(x, y) d x
$$

where $\widehat{n}$ denotes the outward unit normal to the curve $C$, wherever it is defined.

Do the following problems

1. Integrate the 1 -form $y z d x+x z d y+x y d z$ over each of the following curves in $\mathbb{R}^{3}$ that connect $(0,1,0)$ to $(2,1,1)$ :
(a) the straight line from $(0,1,0)$ to $(2,1,1)$,
(b) the lines from $(0,1,0)$ to $(0,1,1)$ to $(2,1,1)$,
(c) the lines from $(0,1,0)$ to $(2,1,0)$ to $(2,1,1)$,
(d) the $\operatorname{arc}\left(2 t,(2 t-1)^{2}, t\right)$, for $0 \leqslant t \leqslant 1$.
2. Let $U$ denote an open subset of $\mathbb{R}^{n}$ that is path connected, and let $F: U \rightarrow \mathbb{R}^{n}$ be a vector field with the property that

$$
\int_{C} F \cdot d \vec{r}=0
$$

for any simple, piece-wise $C^{1}$, closed curve, $C$, contained in $U$.
Let $p$ and $q$ be points in $U$. Since $U$ is path connected, there exists a $C^{1}$ path, $\sigma:[0,1] \rightarrow U$, connecting $p$ to $q$. Assume that $\sigma$ parametrizes a curve $C_{1}$ in $U$. Prove that if $\gamma:[0,1] \rightarrow U$ is another $C^{1}$ path that connects $p$ to $q$, and $C_{2}=\gamma([0,1])$ is paramatrized by $\gamma$, then

$$
\int_{C_{1}} F \cdot d \vec{r}=\int_{C_{2}} F \cdot d \vec{r}
$$

3. Let $U$ denote an open subset of $\mathbb{R}^{n}$ and let $F: U \rightarrow \mathbb{R}^{n}$ be a vector field with the property that $F(v)=\nabla f(v)$ for all $v \in U$, where $f: U \rightarrow \mathbb{R}$ is a $C^{1}$ scalar field.
Prove that if $C$ is any $C^{1}$, simple, closed curve in $U$, then

$$
\int_{C} F \cdot d \vec{r}=0
$$

4. Let $F(x, y)=x^{2} \widehat{i}+y^{2} \widehat{j}$ and $C$ be the boundary of the square with vertices $(0,0),(1,0),(1,1)$ and $(0,1)$, oriented in the counterclockwise sense. Compute the flux of $F$ across $C$.
5. Compute the flux, $\oint_{C} F \cdot \widehat{n} d s$, where $F(x, y)=x \widehat{i}+y \widehat{j}$, for all $(x, y) \in \mathbb{R}^{2}$ and $C$ is the unit circle oriented in the counterclockwise sense.
