Math 152, Fall 2020 Jo Hardin WU # 9

in-class: Tuesday, 9/22/20 due: Wednesday, 9/23/20

Your Name:		
Names of pe	ople you worked with	;

Instructions: Work on this problem in class with your group (if you are attending class synchronously) or out of class (hopefully with a person or two! if you are attending class asynchronously). The problem should be done on a piece of paper with a pencil or on some kind of tablet. The problem should **not** by typed up or done in LaTeX.

Work for a maximum of 15 minutes on the problem (regardless of what time you are working). Do not come back to the problem to "fix it up" or "finish it." Be sure to write down the names of the people you worked with during class (or outside of class).

Take a picture of your work and use a scanning app to create a pdf (or create a pdf directly from your tablet). Upload your work to Gradescope (via Sakai) within 24 hours of class.

Task: Let X_1, X_2, \ldots, X_n be a random sample from $N(\mu, \sigma^2)$. Use moment generating functions to show

$$\overline{X} \sim N(\mu, \sigma^2/n).$$

(Remember, the moment generating function for an arbitrary random variable W is $E[e^{Wt}]$, and many MGF formulations are given on the distribution sheet.)

Note: you are **not** proving the Central Limit Theorem here. Why not?
