## Theorem (A-S, H)

Let n, m be relatively prime positive integers and  $k \in \mathbb{N}$ . Let  $\phi$  denote Euler's totient function, then the triple

$$\left(1, n^{\phi(m)k} - 1, n^{\phi(m)k}\right)$$

is an ABC triple whenever  $\frac{m}{rad(m)} > n$ .

• This result extends from Granville and Tucker

Let n, m be relatively prime positive integers and  $k \in \mathbb{N}$ . Let  $\phi$  denote Euler's totient function, then the triple

$$\left(1, n^{\phi(m)k} - 1, n^{\phi(m)k}\right)$$

is an ABC triple whenever  $\frac{m}{rad(m)} > n$ .

• This result extends from Granville and Tucker

#### Example

When n = 2, take m = k = p where p is an odd prime.

Let n, m be relatively prime positive integers and  $k \in \mathbb{N}$ . Let  $\phi$  denote Euler's totient function, then the triple

$$\left(1, n^{\phi(m)k} - 1, n^{\phi(m)k}\right)$$

is an ABC triple whenever  $\frac{m}{rad(m)} > n$ .

• This result extends from Granville and Tucker

#### Example

When n = 2, take m = k = p where p is an odd prime. The gcd(n, m) = 1.

Let n, m be relatively prime positive integers and  $k \in \mathbb{N}$ . Let  $\phi$  denote Euler's totient function, then the triple

$$\left(1, n^{\phi(m)k} - 1, n^{\phi(m)k}\right)$$

is an ABC triple whenever  $\frac{m}{rad(m)} > n$ .

• This result extends from Granville and Tucker

#### Example

When n = 2, take m = k = p where p is an odd prime. The

$$\mathsf{gcd}(\mathsf{\textit{n}},\mathsf{\textit{m}})=1.$$
 Evaluating  $\phi(\mathsf{\textit{p}})=\mathsf{\textit{p}}-1.$ 

Let n, m be relatively prime positive integers and  $k \in \mathbb{N}$ . Let  $\phi$  denote Euler's totient function, then the triple

$$\left(1, n^{\phi(m)k} - 1, n^{\phi(m)k}\right)$$

is an ABC triple whenever  $\frac{m}{rad(m)} > n$ .

• This result extends from Granville and Tucker

#### Example

When n = 2, take m = k = p where p is an odd prime. The gcd(n, m) = 1. Evaluating  $\phi(p) = p - 1$ . Thus, we get  $(1, 2^{(p-1)p} - 1, 2^{(p-1)p})$ .

### Isomorphisms Between Elliptic Curves

#### Definition

We say that  $E_1$  is  $\mathbb{Q}$ -isomorphic to  $E_2$  if there exists  $\phi: E_1 \to E_2$  with the property that  $\phi(\mathcal{O}_{E_1}) = \mathcal{O}_{E_2}$  and  $\phi$  is defined as

$$\phi(x, y) = (u^{2}x + r, u^{3}y + u^{2}sx + w)$$

where  $u, r, s, w \in \mathbb{Q}$  and  $u \neq 0$ .

### Minimal Models

### Definition

Let E be a rational elliptic curve. A **global minimal model** for E is a Weierstrass model

$$y^2 + a_1 x y + a_3 y = x^3 + a_2 x^2 + a_4 x + a_6$$

such that each  $a_j \in \mathbb{Z}$  and the discriminant  $\Delta$  of the equation is minimal over all  $\mathbb{Q}$ -isomorphic elliptic curves to E.

Good Elliptic Curves: Ongoing Research

### Minimal Models

### Definition

Let E be a rational elliptic curve. A **global minimal model** for E is a Weierstrass model

$$y^2 + a_1 x y + a_3 y = x^3 + a_2 x^2 + a_4 x + a_6$$

such that each  $a_j \in \mathbb{Z}$  and the discriminant  $\Delta$  of the equation is minimal over all  $\mathbb{Q}$ -isomorphic elliptic curves to E.

### Definition

We call the discriminant of a global minimal model the **minimal discriminant of** E, denoted  $\Delta_E^{\min}$ .
